Infrastructure for the Agentic Enterprise

Codifix is the plumbing and electrical wiring for the Agentic Enterprise.

Your platforms keep their interfaces. Codifix does the integration.

Connect existing AI platforms, agents and enterprise expertise.

Great AI platforms.
A disconnected enterprise.

Application team

AI platform + agents
Change history and symptoms

Platform team

AI platform + agents
Runbooks and infrastructure context

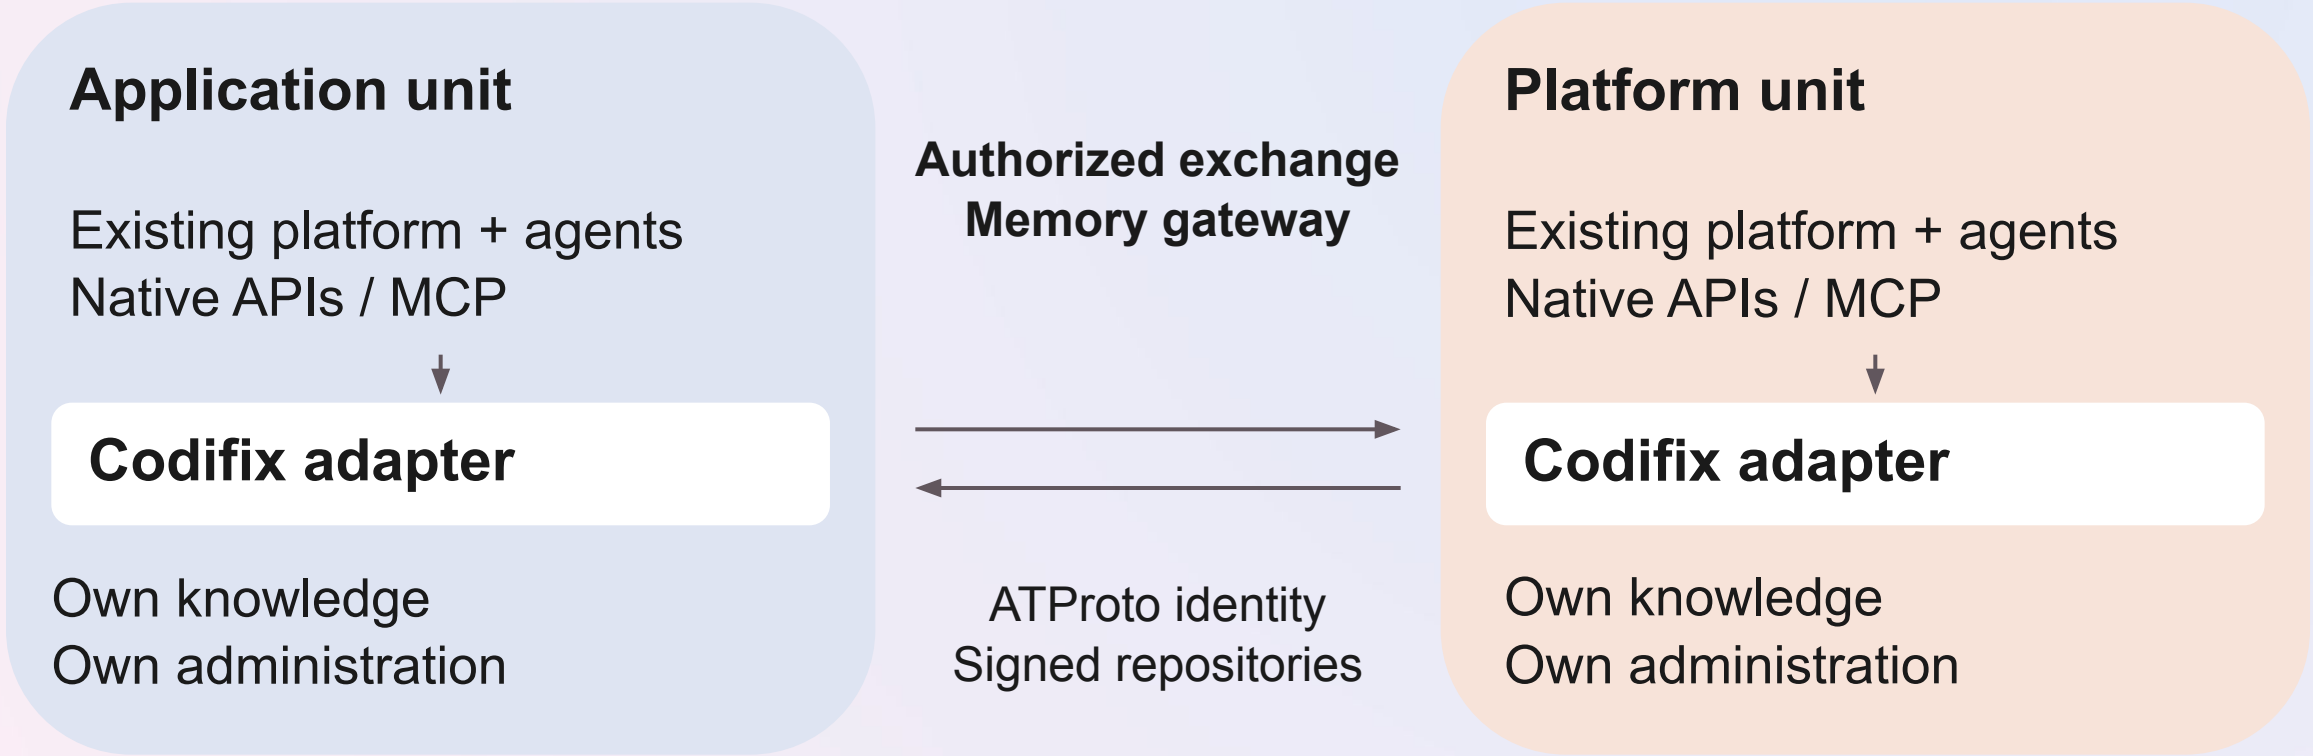

Context stays local

Connections rebuilt

Controls rechecked

Illustrative problem to validate in discovery.

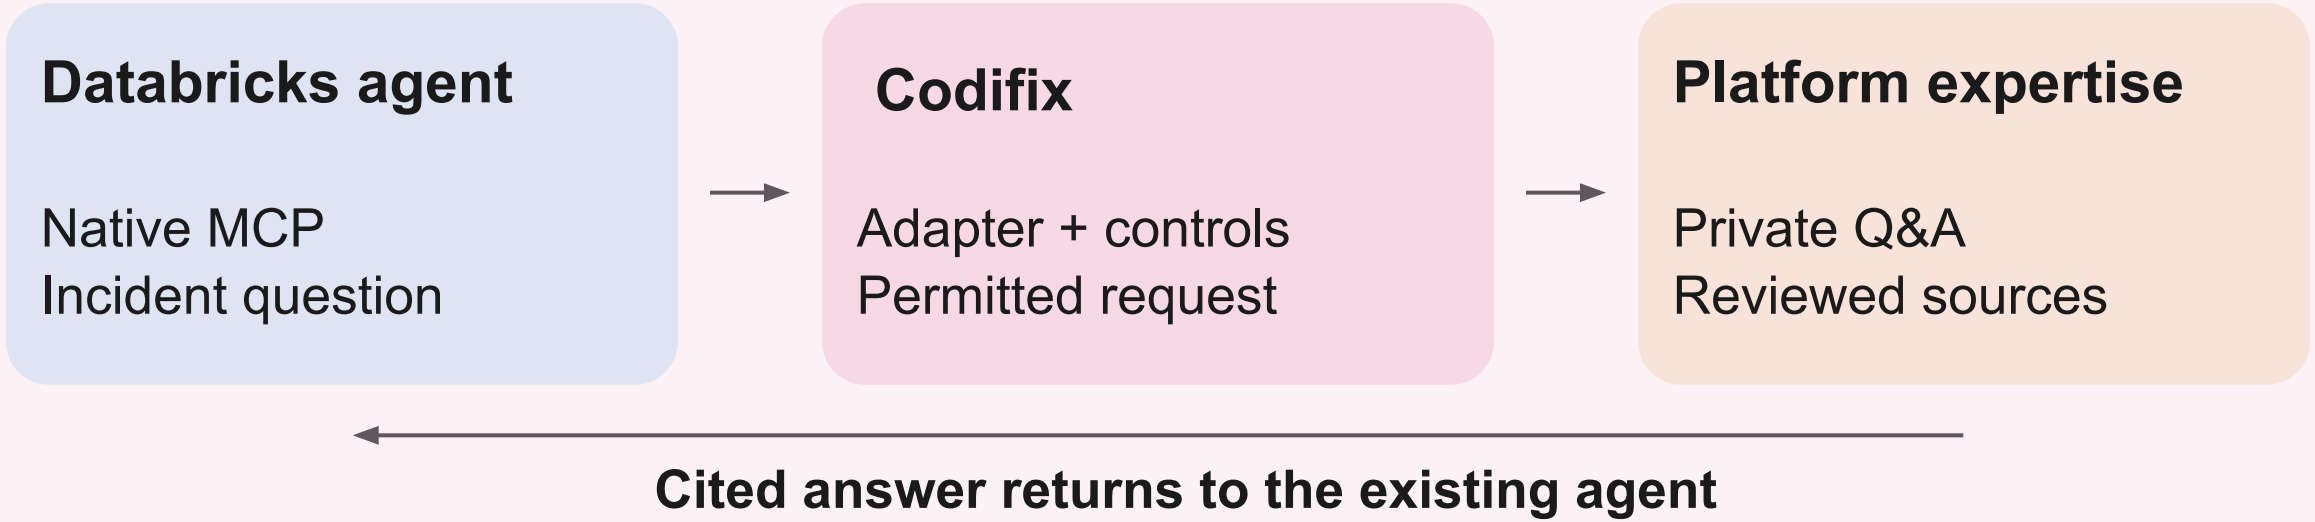

Your platforms keep their interfaces. Codifix connects them.

Architecture direction: Codifix builds adapters and maps permissions.

Databricks plugs into the network

Proposed integration using supported interfaces

Payment latency: check the permitted runbook.
A responder acts; the source team reviews corrections for later reuse.

No platform rewrite or ATProto adoption. Connector configuration still required.

Build the infrastructure once. Extend transformation.

Reuse connections	Less repeated integration effort
Reuse reviewed knowledge	Faster correct action; fewer interruptions
Keep explicit controls	Lower disclosure and rework risk

Measure onboarding effort, correct action, failures and full delivery cost.

Value hypotheses. Recovered staff capacity is not automatically cash saved.

Working foundations.
The next proof points.

Today	**Memory interfaces, federation and private Q&A** Implemented components; controlled demonstrations.
Next	**A verified Databricks connection** Permissions, consent, citations and recovery tested end to end.
Then	**A measured customer pilot** Quality, operating value and delivery economics.

Controlled evidence does not establish customer readiness or quality improvement.

Start with two teams.
Expand across the enterprise.

Olivier Van Acker · creator of Memory Layer

Rust platform, MCP integration and evaluation tooling

Repeatable integrations	Connect existing platforms with explicit controls.
Measurable customer value	Prove one workflow with a qualified pilot.
Viable delivery economics	Validate cost, support and onboarding effort.

Discuss the milestones and financing structure.

Planned: nine employees + fractional counsel. Round size follows scope and evidence.

Architecture today. Communication tomorrow.

ATProto foundation

Identity + signed records
Extensible schemas and services

Memory governance

Authorization + publication history
Private Q&A through the gateway

Trust boundaries

Trusted gateway; authorized copies remain readable.
Revocation cannot recall copies. Signatures do not establish truth.

Neuralese · future research

Machine-native agent communication: compatibility, evaluation and auditability first.

Operating model and funding scenarios

24-month funding objective	London · GBP	New York · USD
Gross funding requirement	£3.23m	$4.91m
Expected employee AI spend	£420k	$566k
AI headroom retained as cash	£420k	$566k
M25–27 operating buffer	£504k	$744k

Planned: nine employees + fractional counsel; assurance lead included.

New York in common GBP: £3.65m at $1.3476/£. Alternative bases.

AI headroom is cash. External assurance and broader connector/research costs need validation.
